

# Secure Every Entry. Command Every Space.

The Nuveq Integrated  
Security Ecosystem.

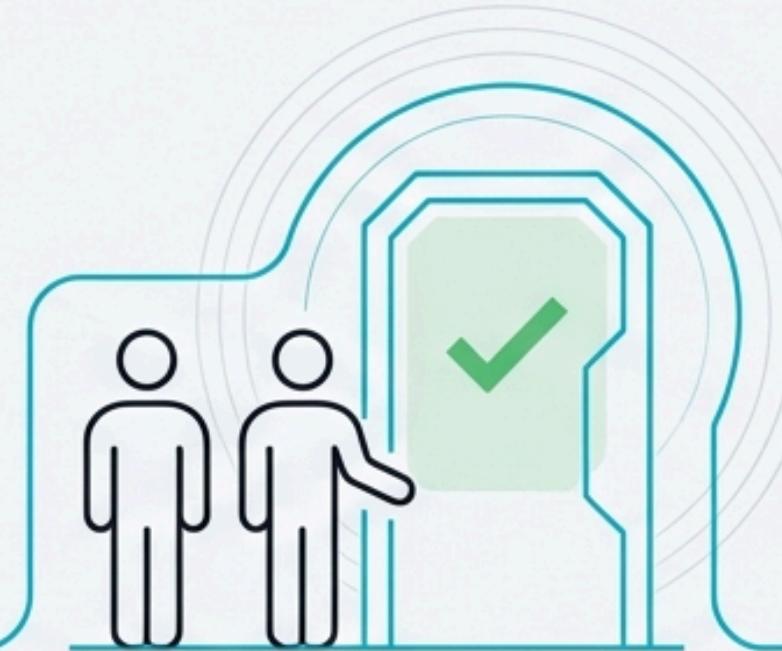

# Modern Security Demands More Than a Lock. It Demands Accountability.

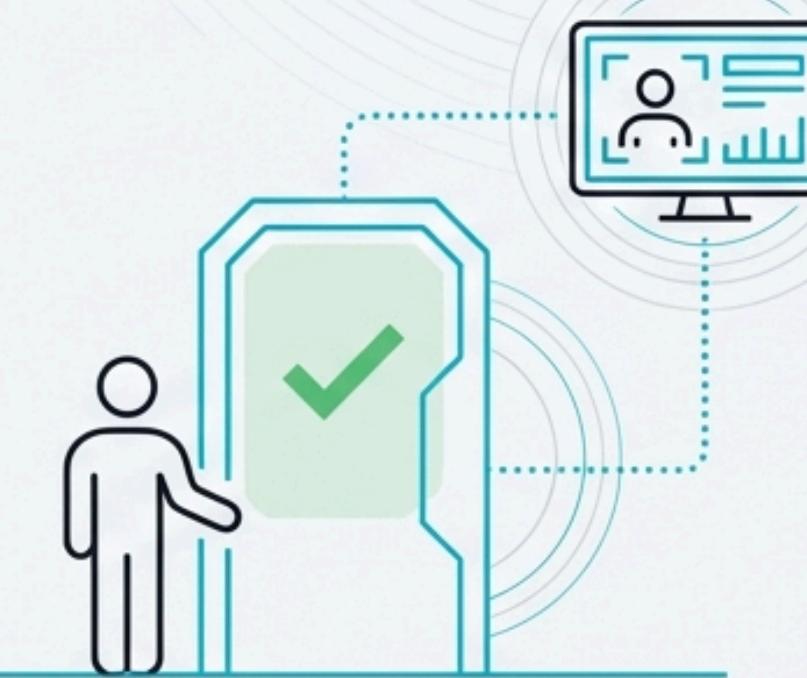

In critical environments, the most significant risks often lie not in unauthorized entry, but in unverified actions. True security requires granular control over *how* and *when* authorized personnel access sensitive areas, ensuring every action is intentional, supervised, and auditable. How do you enforce joint sign-offs, mandate supervisor presence, or require real-time command center approval without hindering operations?

**DENIED:** Single User

**APPROVED:** Joint Sign-off

**APPROVED:** Remote Approval

# Introducing Dual Access Mode: Three Protocols for Evolving Security Needs

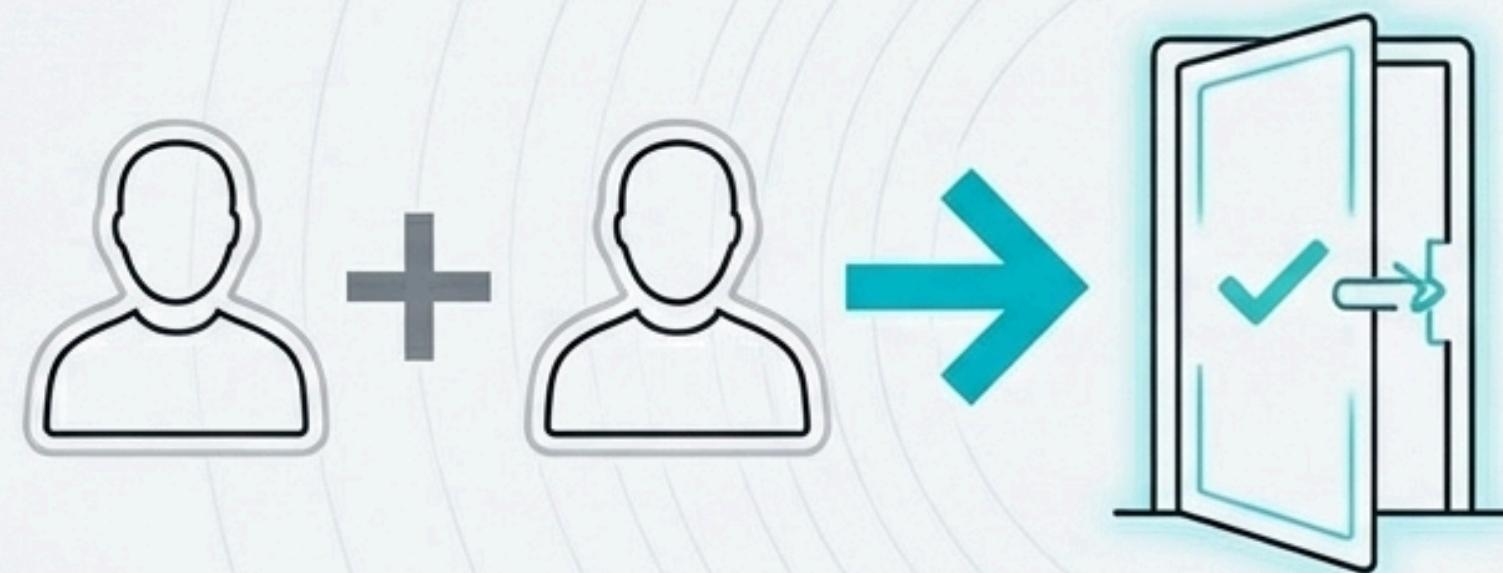

Elevate security and accountability with three distinct protocols designed to meet any operational requirement, from joint collaboration to centralized oversight. Control access confidently with multiple layers of security, ensuring your facility is secure, compliant, and fully auditable while providing seamless, flexible access for authorized personnel.

# Mode 1: Flexible Multi-User Access for Joint Accountability.

This mode is designed for joint accountability and dynamic collaboration. It allows any two authorized users to initiate and complete the access process, regardless of their specific roles or departments.

- **Versatile Authorization:** Allows any two parties—whether two technicians, an operator and a manager, or two independent security officers—to achieve necessary joint sign-off.
- **Role-Agnostic Collaboration:** Supports users from the same team or from completely distinct functions.

## Mode 2: Supervised Access Mandate for Enforced Oversight

This protocol is for areas requiring mandatory on-site oversight, enforcing compliance and accountability by linking operational activity directly to supervisory control.

- **Mandatory Pairing:** Access is strictly enforced, requiring the physical presence of **One Operational User + One Manager** for entry.
- **Ensured Oversight:** Provides an essential extra layer of managerial responsibility, as the supervisor must be physically present to authenticate.

## Mode 3: Command Center Access on Approval (AoA) for Centralized Control

This mode enforces the highest level of real-time security control, ensuring every entry is explicitly and remotely approved by a designated authority.

# The Tangible Benefits of Granular Access Control

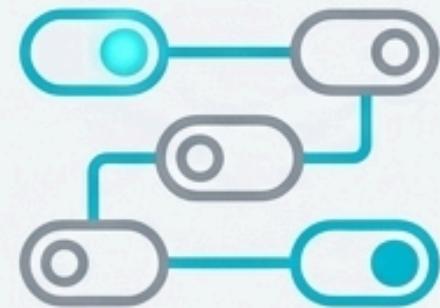

## Multi-User Verification for Sensitive Zones

Ensure critical areas are accessed only when multiple authorized users validate entry together, reducing the risk of unauthorized access.

## Real-Time Approval Workflow

Access requests trigger instant notifications to supervisors or the command center, allowing secure and timely approvals from any location.

## Flexible Security Configuration

Customize access rules to match your precise operational needs, whether it's collaborative entry, manager validation, or approval-based workflows.

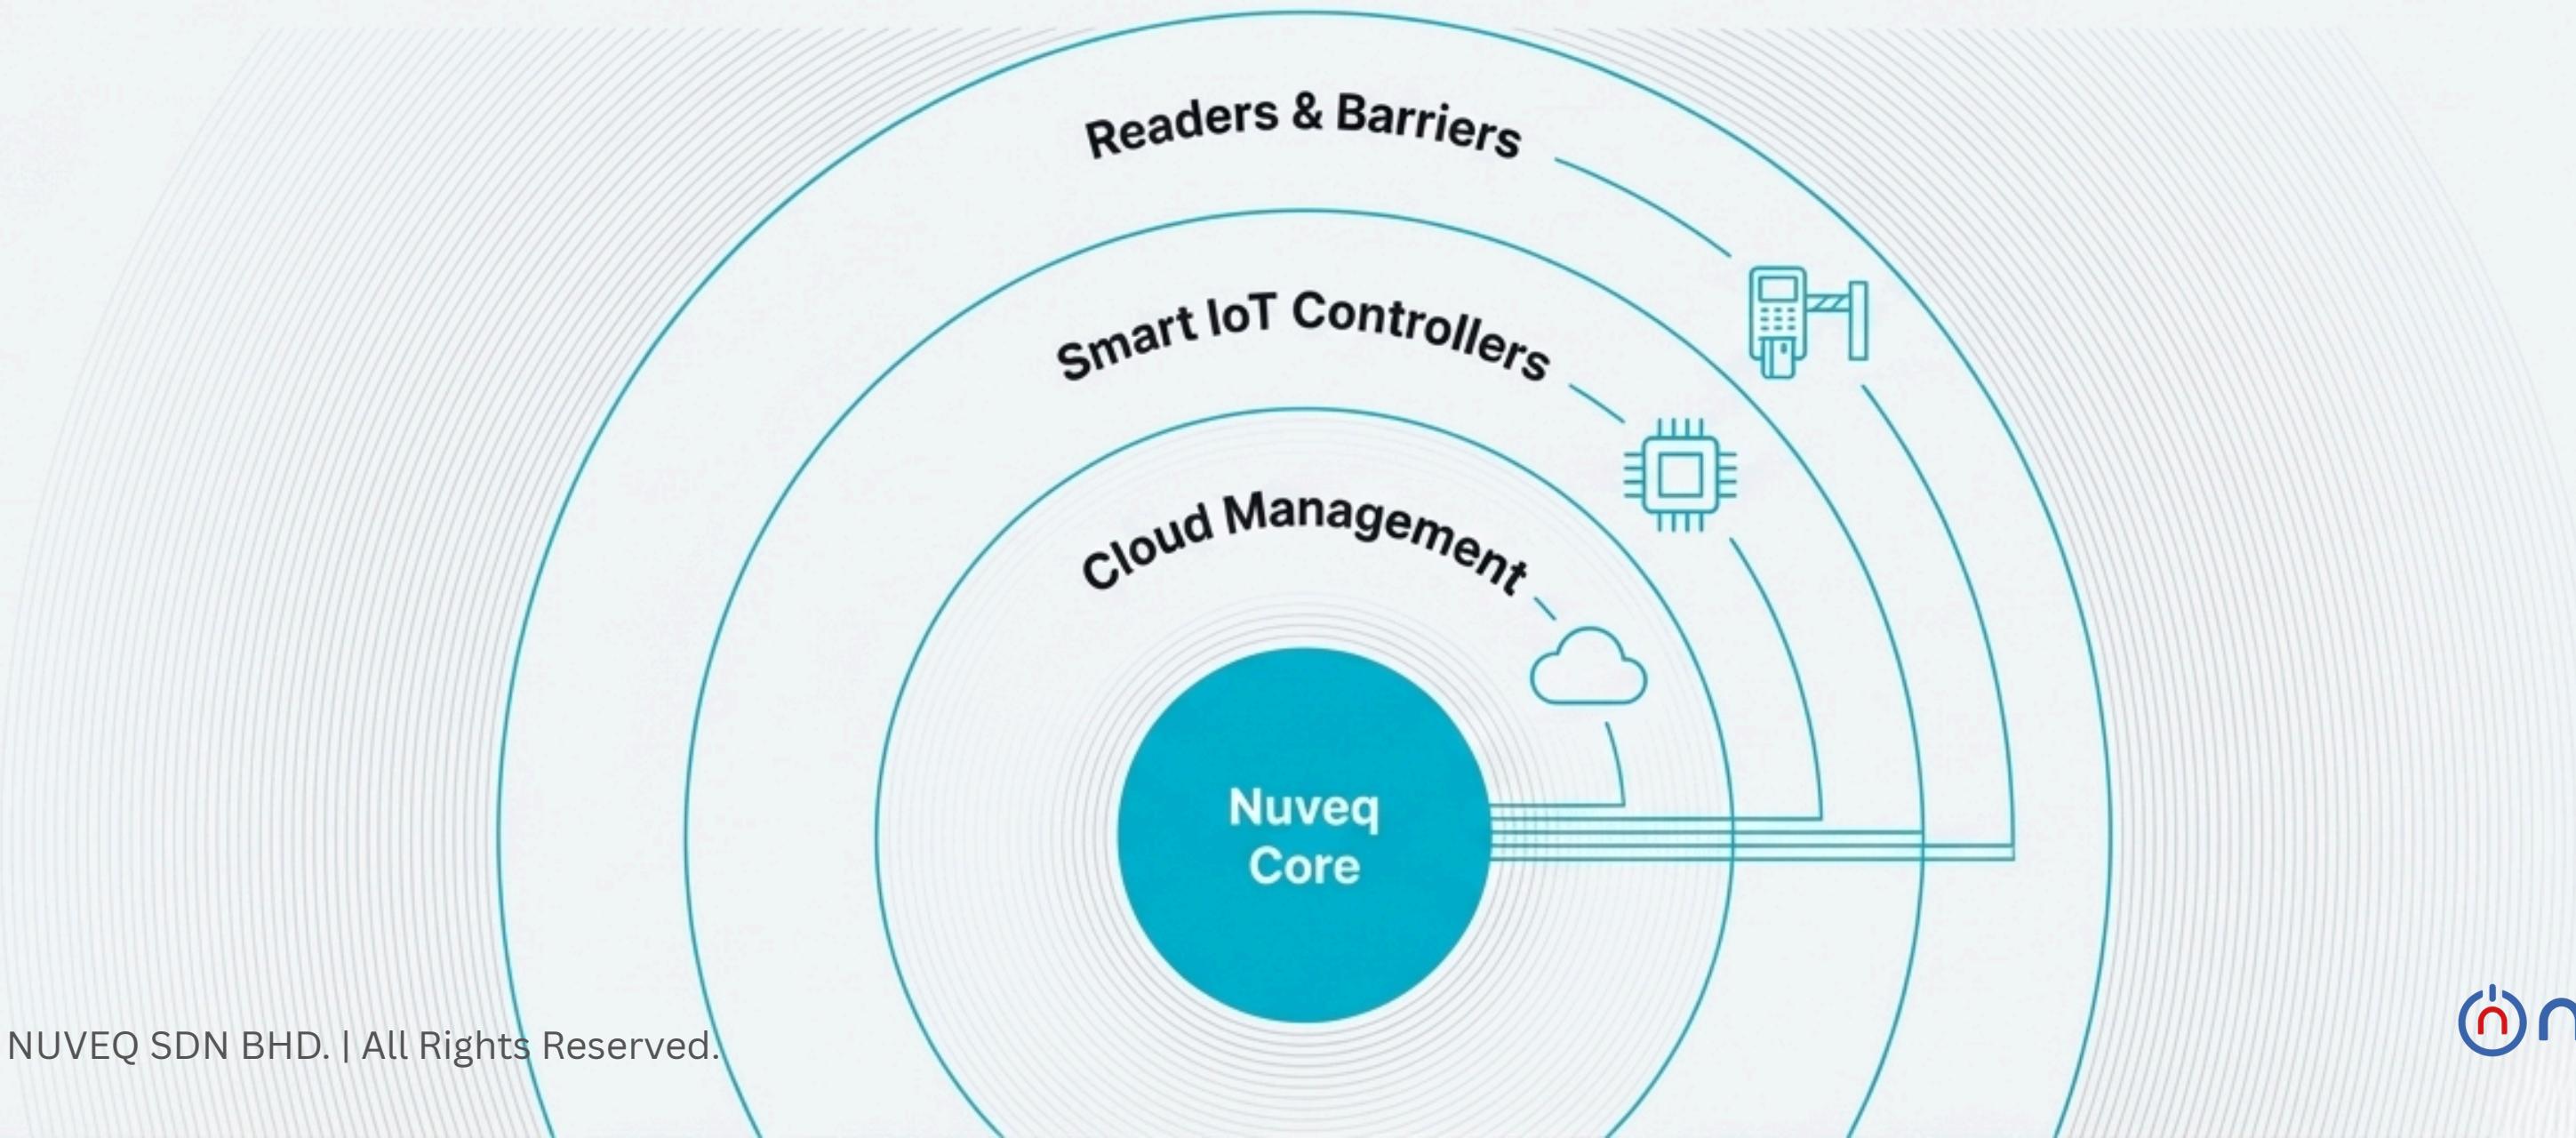

## Traceable and Auditable Entry Records

Every entry is logged and monitored, providing detailed, tamper-proof records for compliance, accountability, and security audits.

# Advanced Control is Powered by an Integrated Ecosystem

Dual Access Mode is not a standalone feature; it is the result of a seamlessly integrated platform of cloud software, smart IoT controllers, and advanced readers. This end-to-end approach ensures reliability, scalability, and deep system intelligence.

# The Command Center: Cloud-Based Management & Mobile Credentials.

**Cloud-based Management Platform:** Centralize control across single or multiple sites.

**Cloud-based Property Management System:** Streamline operations and tenant management.

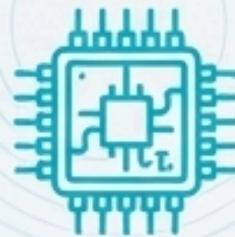

**Mydigital ID & Mobile Credentials:** Provide secure, convenient access via mobile devices.

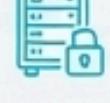

Underpinned by **Google's ULTRA SECURE Cloud Platform** for unmatched reliability and security.

**Limitless Updates:** An eco-friendly system that evolves with your needs without hardware replacement.

# The Intelligent Edge: A Comprehensive Suite of Hardware

## Smart IoT Controllers

-  IoT Access Control System
-  Elevator Access
-  I/O Modules
-  Panic Alarm
-  Door Monitoring
-  Vehicle Access (ANPR)
-  Server Rack Lock

## Smart Readers

-  Multi-format BLE/NFC/QR Reader
-  Encrypted NFC Cards
-  AI Biometrics Recognition Terminals (Indoor, Outdoor, Outdoor IK10)

## Security Barriers & Turnstiles

-  Access Barrier Gates (Folding, Fence Arm)
-  Turnstiles (Swing, Full Height, Tripod, Portable, Quantum)

# A Foundation of Enterprise-Grade Security Features.

Beyond multi-user authorization, the Nuveq platform provides a full suite of advanced tools to protect your assets and people.

- ✓ Emergency Lockdown
- ✓ Global Management
- ✓ Anti-Passback
- ✓ Door Interlocking
- ✓ Intrusion Alerts
- ✓ Fire Alarm Integration
- ✓ Emergency Mustering System
- ✓ Access Groups and Roles Management

# Adaptable Solutions for the Most Demanding Industries

The Nuveq open access control solution is tailored to meet the unique security, compliance, and operational needs of diverse sectors.

**Data Centers**

**Banking & Financial**

**Local Government**

**Manufacturing & Industrial**

**Healthcare Facilities**

**Commercial Real Estate**

**Education**

**Gym & Fitness**

# Built for Integration, Designed for Evolution.

A secure facility requires a connected technology stack. Nuveq is built on an open foundation to ensure it works with your existing systems and grows with your future needs.

## Full API Integration

Utilize our Developer API to create custom workflows, integrate with HRMS or other platforms, and extend the system's capabilities.

## Streamlined Operations

Unify security management to reduce complexity and improve operational efficiency.

## Limitless Updates

Benefit from continuous improvement and new features delivered seamlessly via the cloud.

# Secure Every Entry with Nuveq.

From Multi-Layered Verification and Supervisor Oversight to Real-Time Command Center Approval, Nuveq delivers the tools you need for maximum safety and compliance.
